

Study objective and design

The primary objective was to evaluate the efficacy of Drug A.

This was a randomized, double-blind, placebo-controlled study.

The treatment duration was twelve weeks.

Participants and treatment

The study enrolled 120 adults between 18 and 65 years of age.

Participants received either Drug A 10 mg or placebo once daily.

Treatment was administered orally for twelve weeks.

Safety assessment

The primary safety endpoint was the incidence of treatment-emergent adverse events.

Adverse events were assessed at every study visit.

Serious adverse events and treatment discontinuations were also recorded.
